

PROJECT

It is possible to produce the space technologies seen in films like **The Orville** or **Star Wars** within exactly 15 to 30 years; the details are in previous files. The challenge lies in whether I can extract the subatomic electron codes for the 666 "good attributes." I might only be able to extract 300 of them. We need to guarantee right now that the rest will be extracted. I need to apply a rigorous writing method intensively—8 to 12 hours a day, continuously—for a period of one year. By the end of that year, I will have generated an IQ of 300 and cells and DNA that are 200 times stronger. DNA that is 200 times stronger implies a generation more resilient to space conditions; if, for instance, a planetary alignment involving three or four planets occurs in 2028 or 2029, and if conception is timed with that alignment—just as it was for my own birth—and if specific tasks like handicrafts, coordinate-based drawings, and Sudoku puzzles are performed, then individuals capable of extracting the subatomic electron codes for the remaining good attributes will be born. Incidentally, in **The Ark**, they manipulated genetics to produce individuals more resilient to space conditions because it was necessary, but that process is not natural.

In other words, they will possess strong genes, like Lieutenant Garnet on the right.

They will be more resistant to radiation.

The project should proceed as follows:

I am an individual motivated by my own achievements.

I want to establish my own country. I intend to build a nation out of piled desert sand—like the one shown in the image below—at a suitable location in the Pacific or Atlantic.

The specific site will be determined later, based on factors such as fault lines, tsunamis, waterspouts, hurricanes, and precipitation patterns.

It is necessary to act prudently and with foresight now regarding potential situations the project may face in the future.

If I am unable to extract the subatomic electron codes for all 666 positive attributes, individuals who meet the same requirements and possess the same underlying structure will be needed to extract the remaining codes.

I might only be able to extract the subatomic electron codes for 300 of these positive attributes. Individuals capable of continuing the extraction of the remaining 366 positive attributes will be required. Those who will extract the remaining codes in the future should follow this method:

Initially, they might find it too taxing for their brains to write the same positive attribute with both hands simultaneously, or to write two different positive attributes at the same time. Therefore, practicing by writing two different positive attributes—one with each hand—for the 74 positive attributes of a single chakra might not overwhelm their brains. It is wise to take precautions now.

I need to continue practicing the method of writing two different adjectives simultaneously with both hands for a full year.

At the end of the year, sperm with an IQ of 300 and cells and genes 200 times more powerful will be produced.

The plan involves partnering with the most profitable pharmaceutical company in a developed nation to produce cancer and HIV using potent cells, establishing a "Global Constitutional Mothers Foundation," and building new cities in developed countries—all to ensure the birth of individuals capable of accessing space resources and sustaining the project. Instead of struggling for the sake of a single person, there will be as many highly talented individuals as desired—drawn from their own nations—who can secure access to space resources.

At the end of the year, I, too, will set about establishing my own country and releasing the codes. Once the codes are out, I'll sell them to developed nations in exchange for a cocktail and a check. There's no need for complications.
